Introduction

The World's Megacities

(with populations exceeding 10 million)

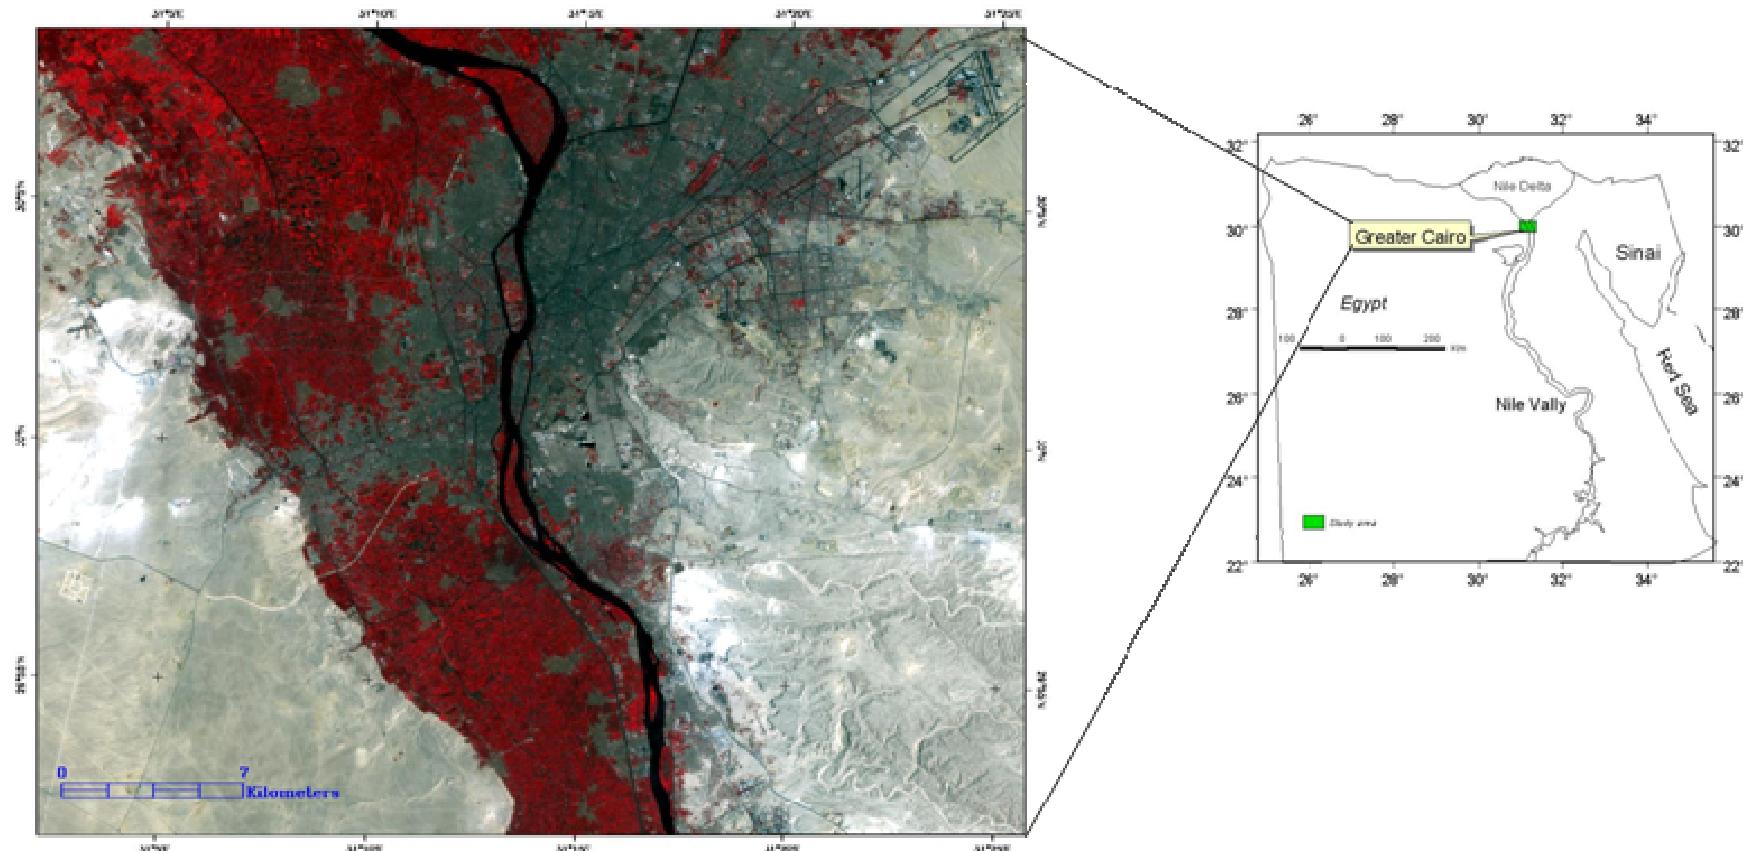

<http://www.megacitiesproject.org/>

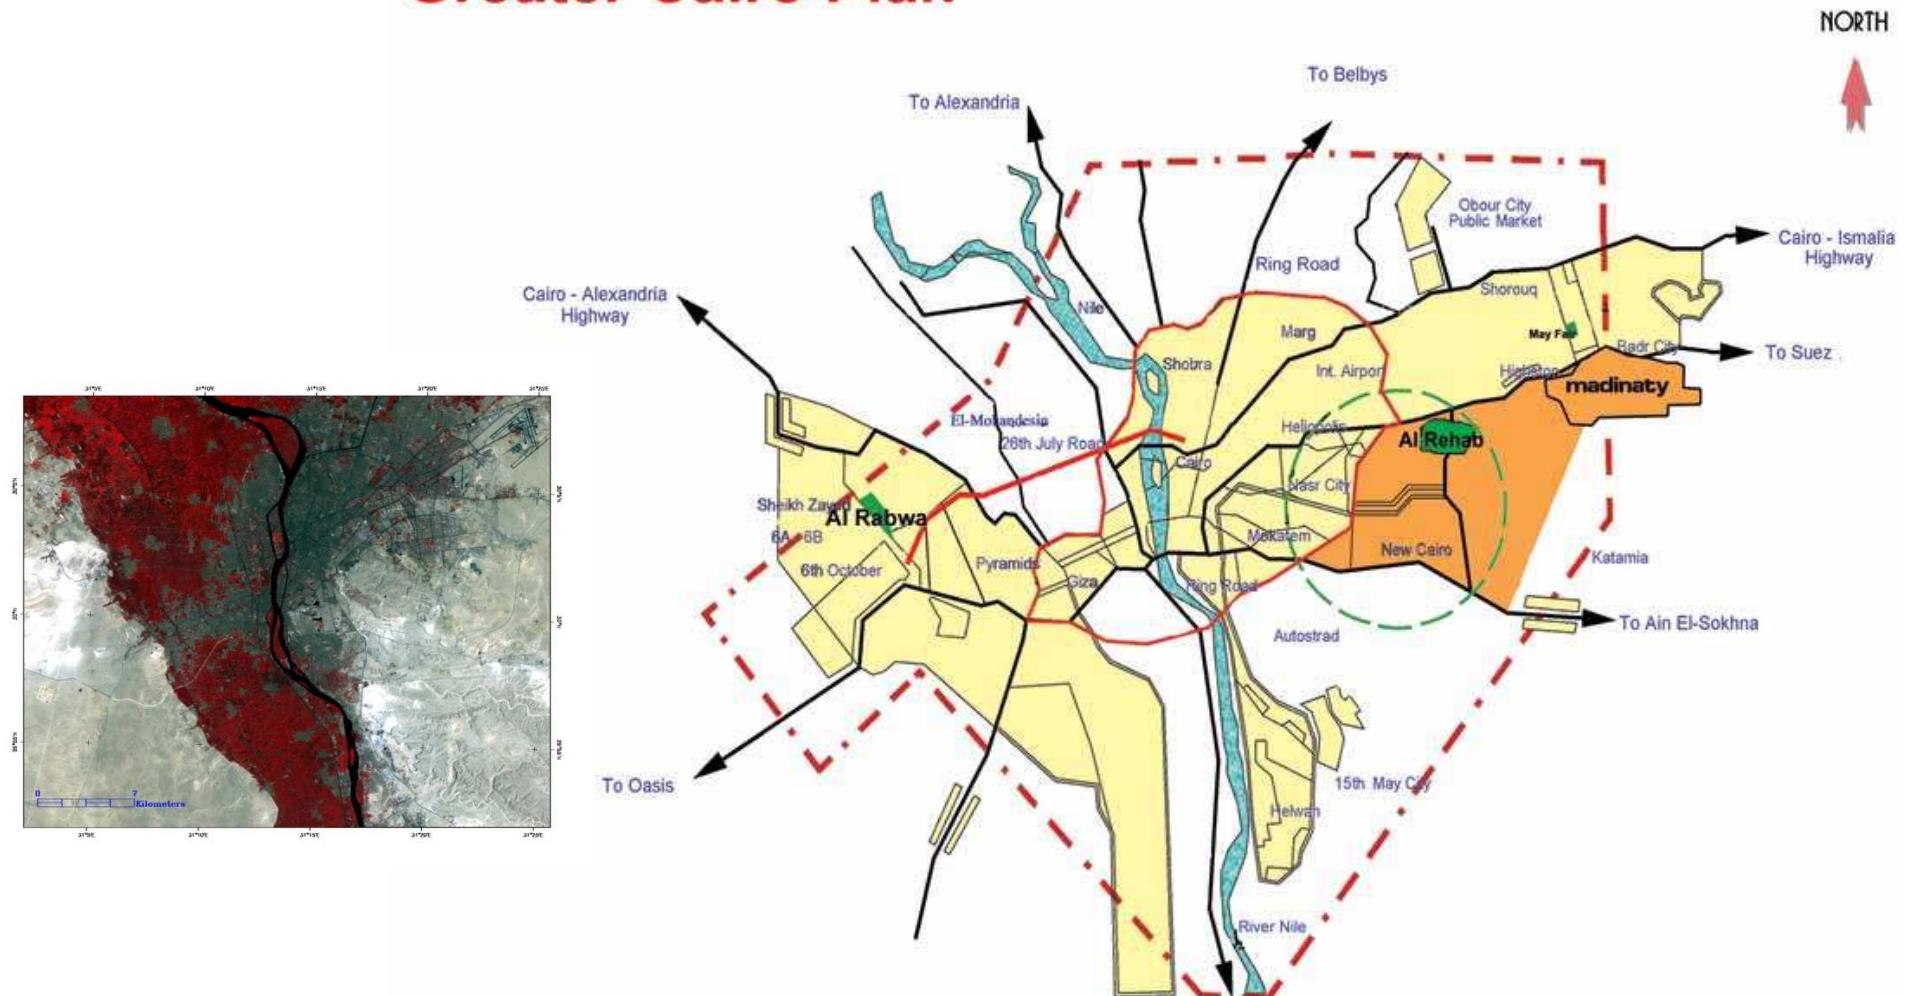

Problems:

- Population growth
- Housing crisis
- Loss of fertile lands

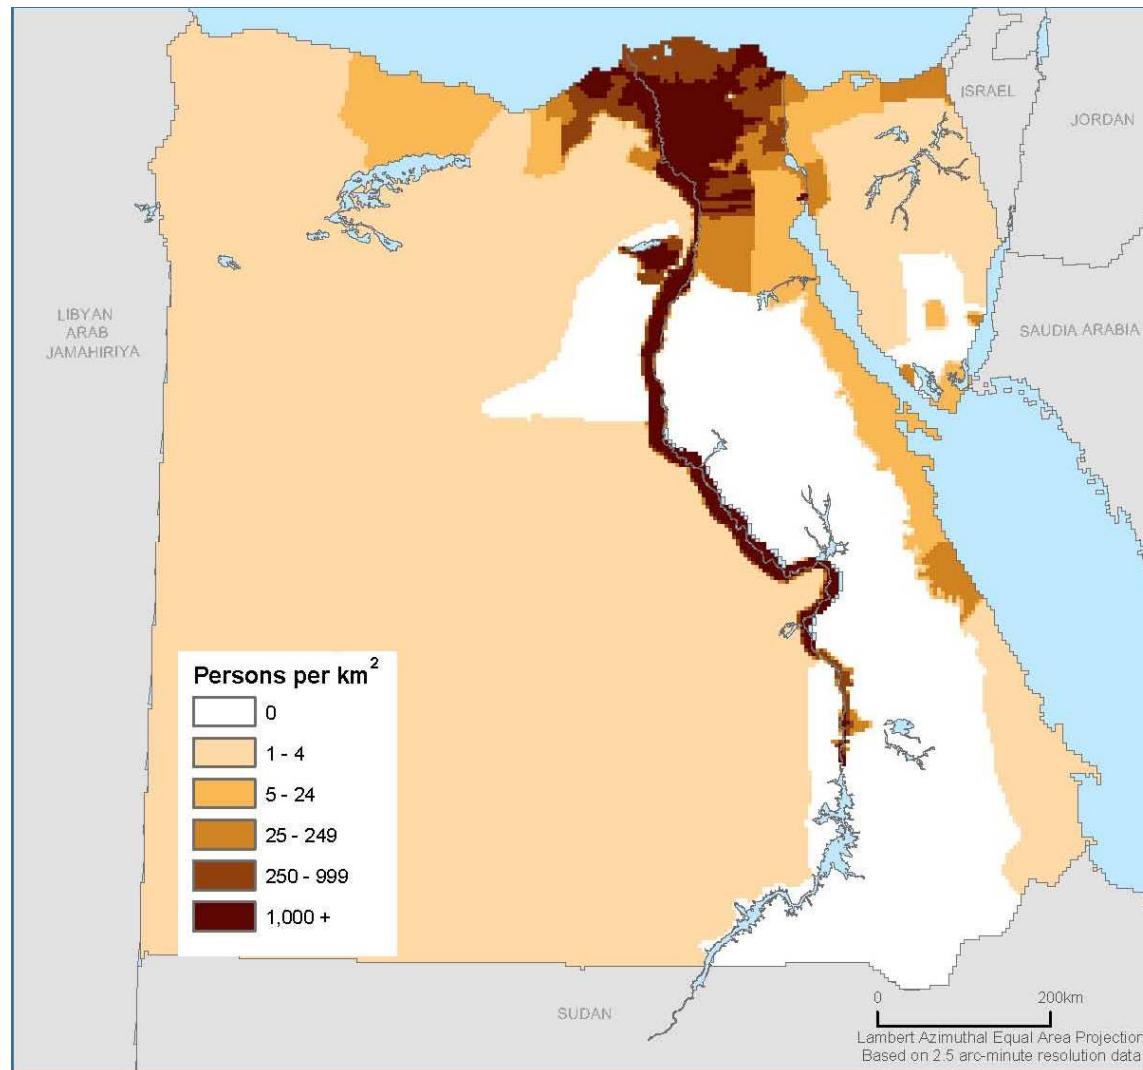

Location Map of Greater Cairo

Greater Cairo Plan

Urbanization:

- Urbanization or urban drift is the *physical growth* of urban areas as a result of global change.
- Urbanization is also defined by the United Nations as movement of people from rural to urban areas with population growth equating to urban migration. The United Nations projected that half of the world's population would live in urban areas at the end of 2008.

Objective:

- To show some of different remote sensing techniques to analyze the expansion of Greater Cairo
- Using different levels of classification based on the target and object (LU/LC and urban areas).

Materials and Method

Materials:

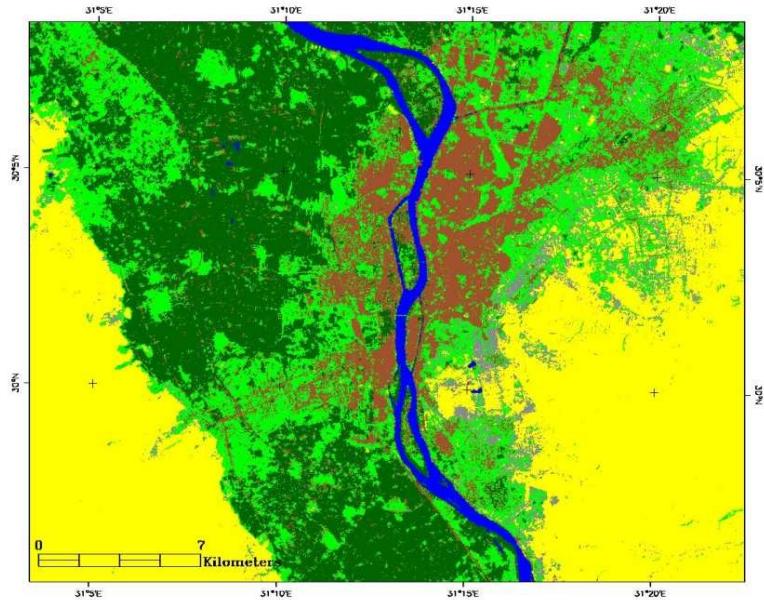

- Three Landsat TM & ETM images dates (path 176, row 39): 1984, 1990, and 2006 (the image of 1984 consider as the reference year for the other images).
- Multi-spectral spot mosaic acquired on 2006 has been chosen.

Method:

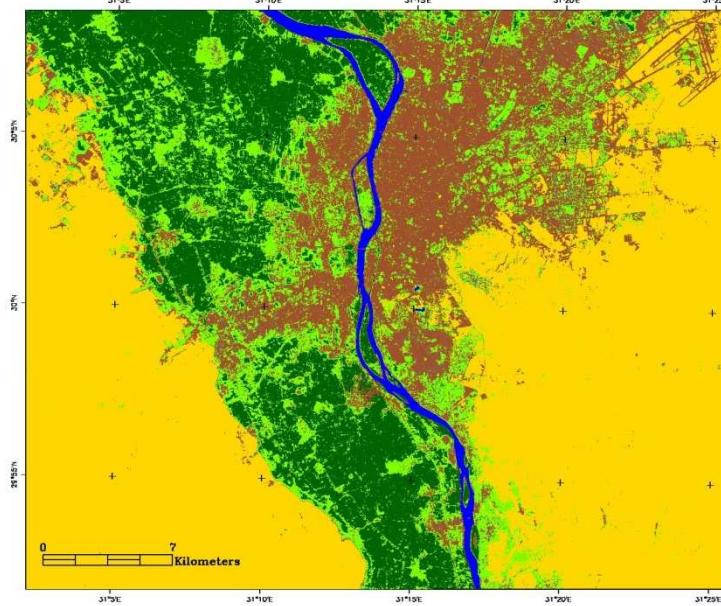

- Image processing
(Enhancement)
- Pixel-based classification
(First level of classification)
- Object-based classification
(More levels of classification)
- Data management by GIS
(Raster to Vector)

Results

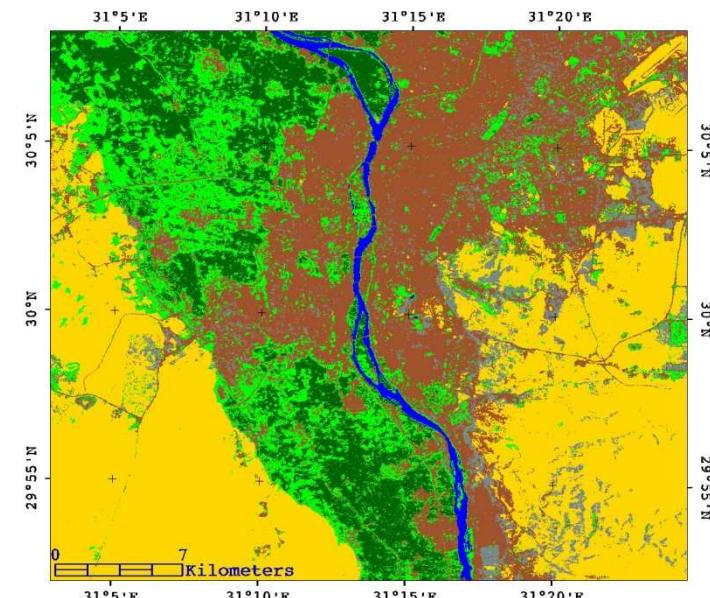

Pixel-based classification

1984

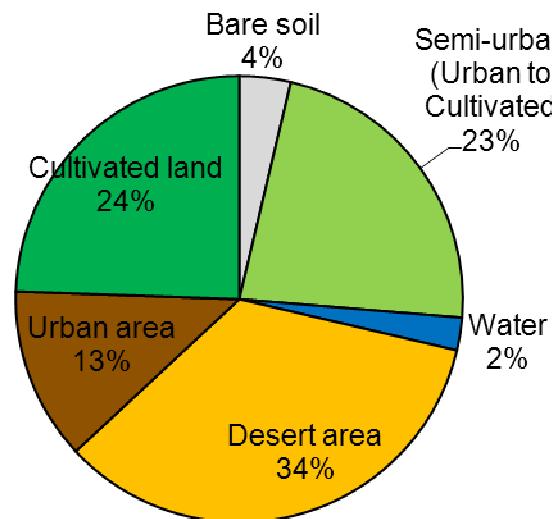

1990

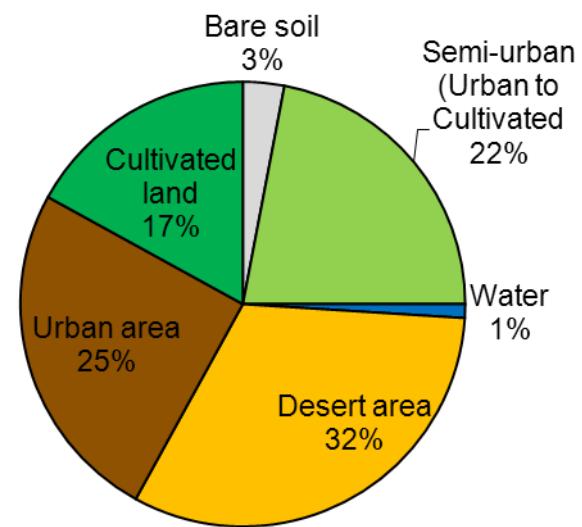

2006

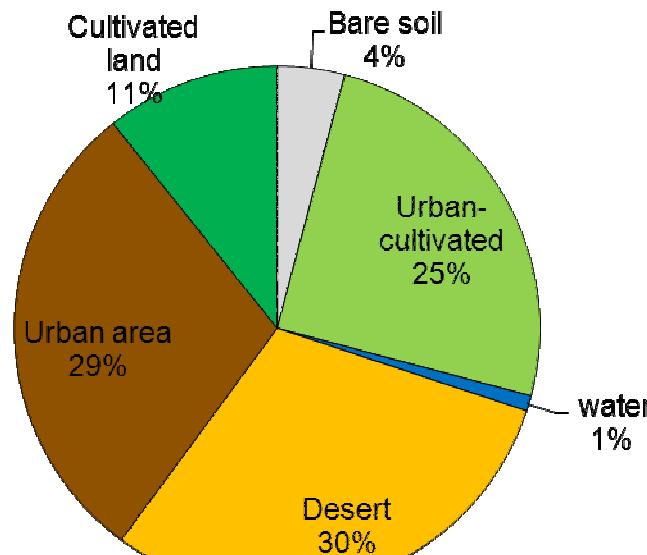

1984

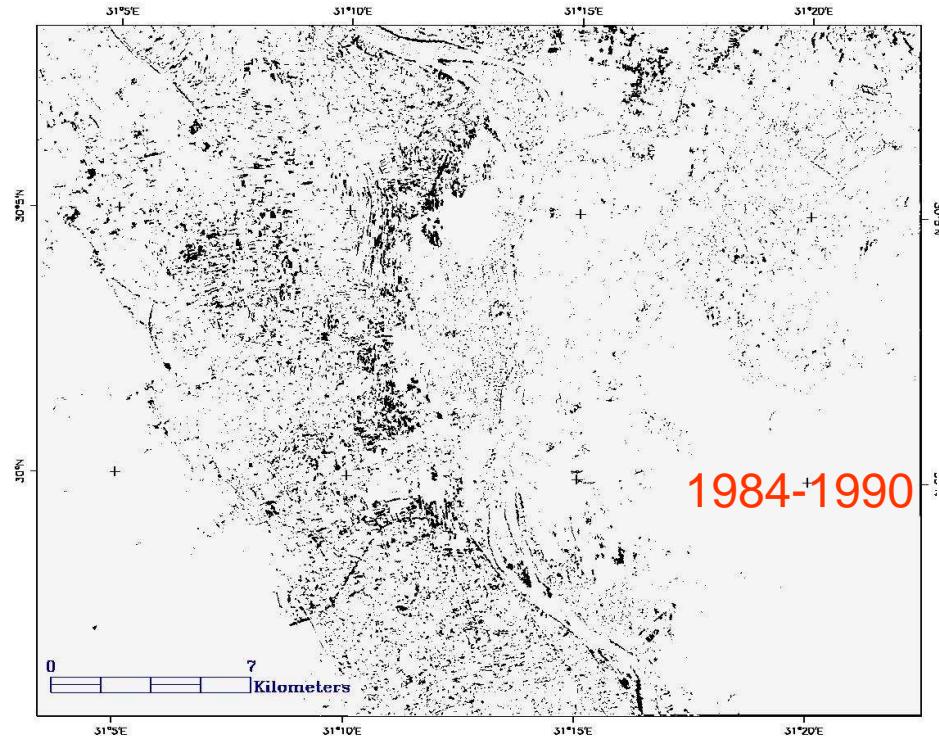

1990

2006

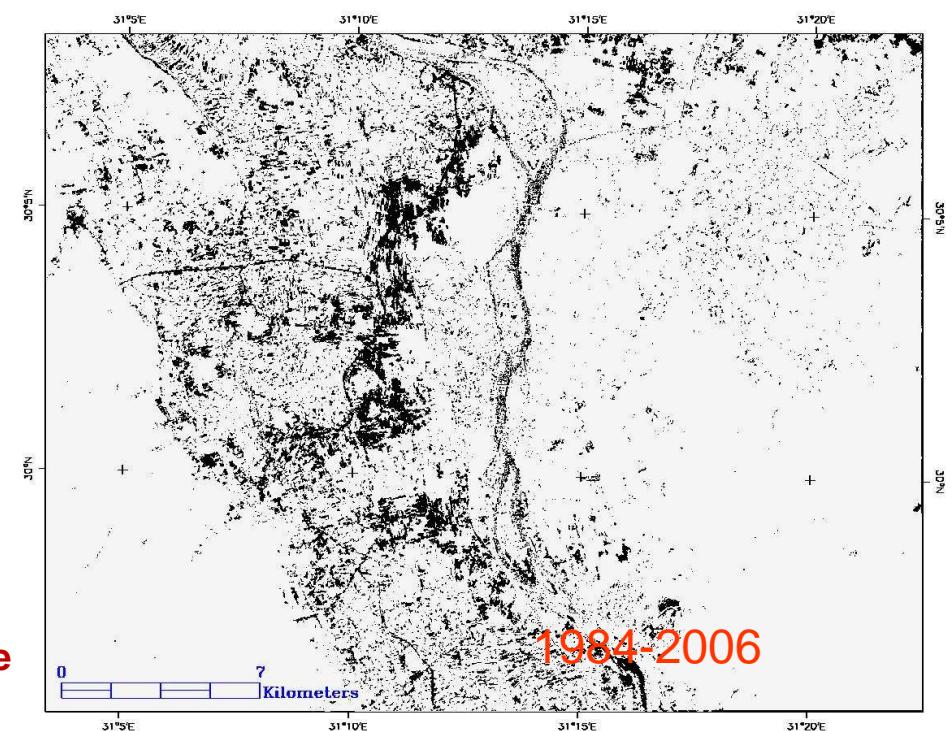

The Normalization Difference Vegetation Index (NDVI)

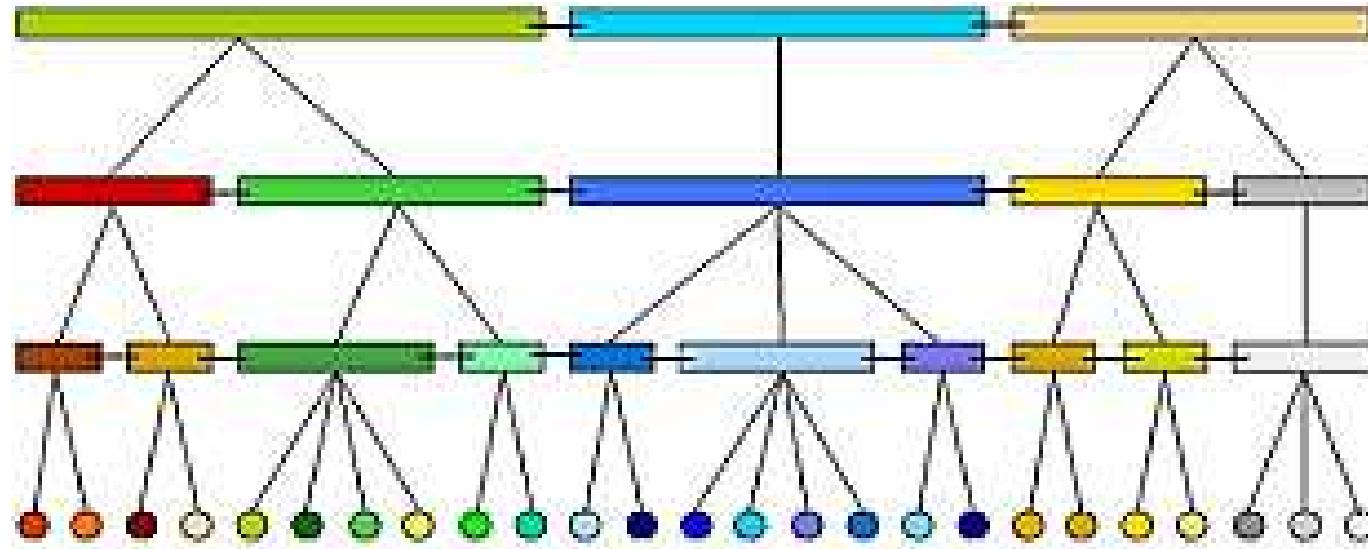

The degree of changes of cultivated land based on NDVI indices

Note: the dark area represents high degree of change

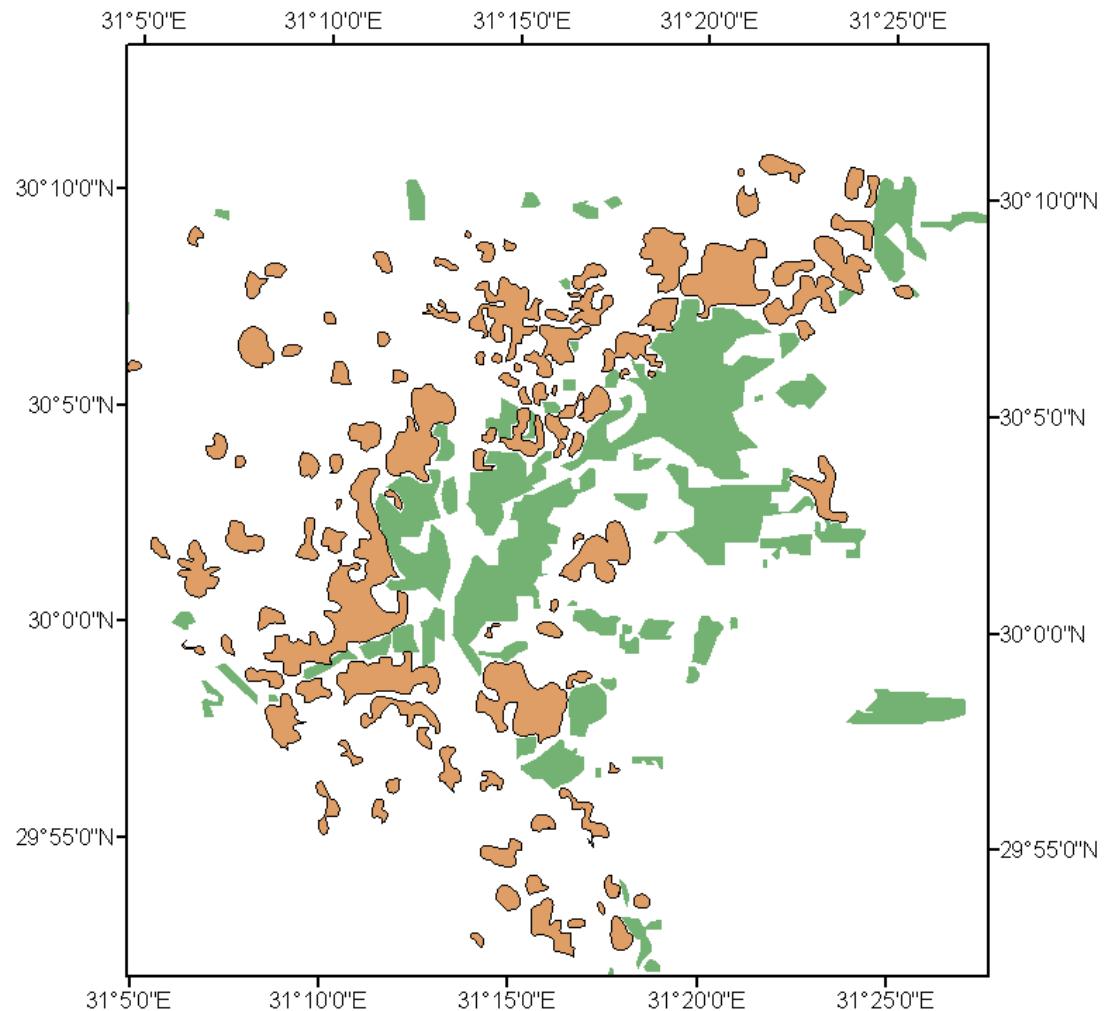

Object-based classification concept (Multiresolution segmentation)

- Hierarchical network of segments in different scale levels
- Choice of proper thresholds for homogeneity and heterogeneity criteria

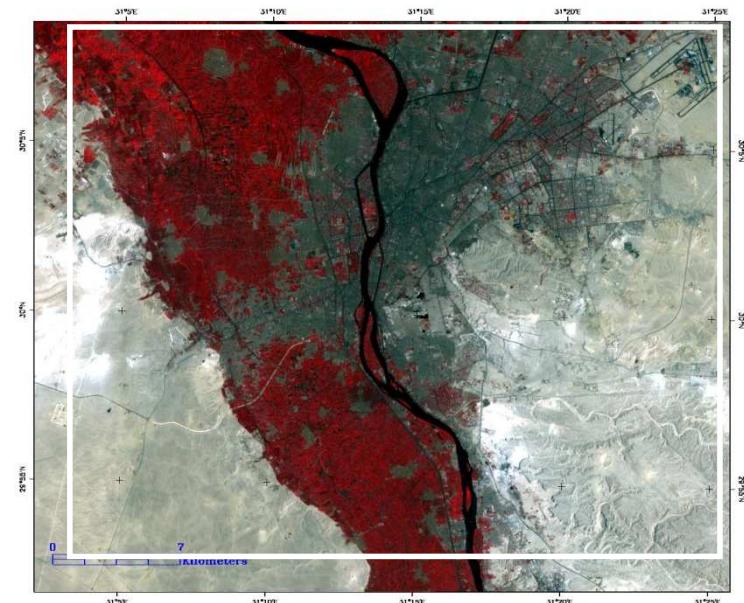

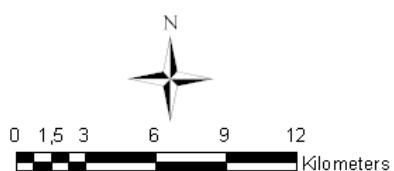

* After eCognition / Definiens

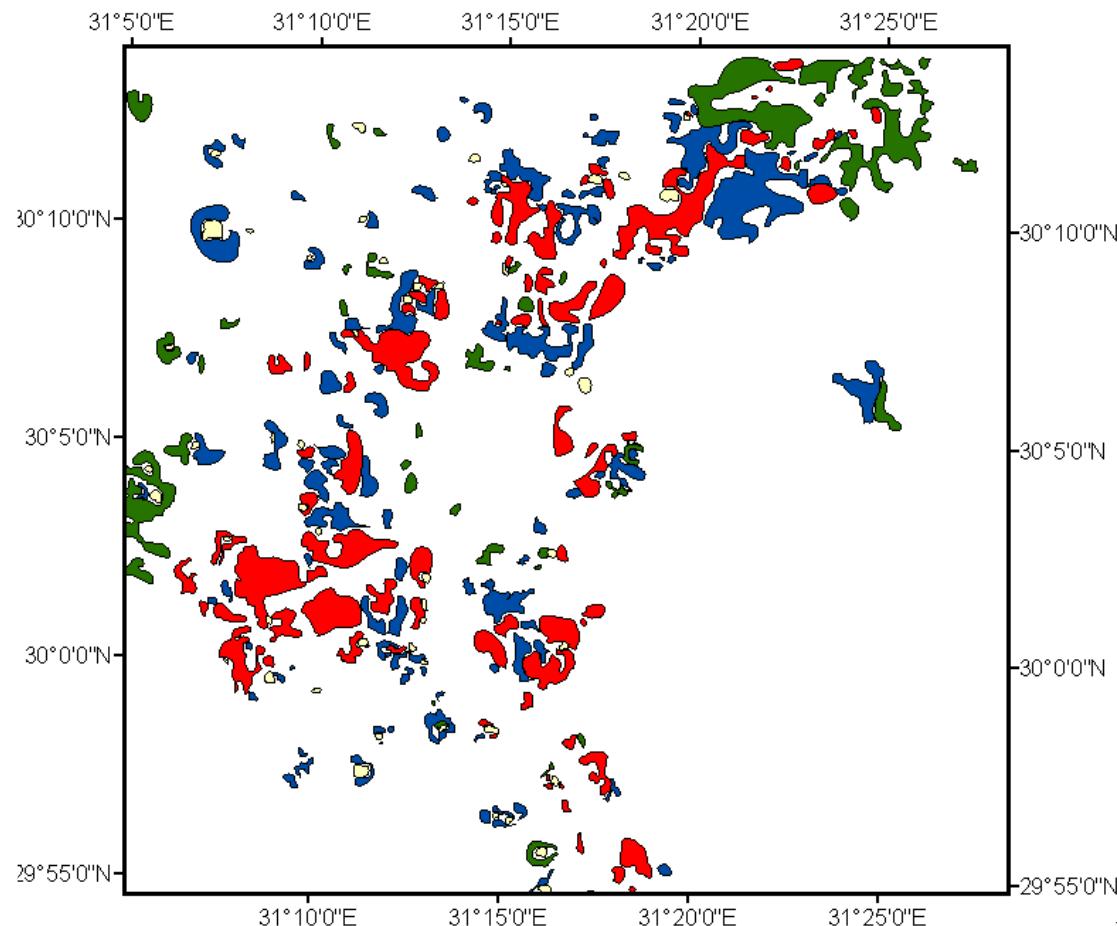

**Legend**

- Formal building
- informal building

Objects in the second level classification hierarchy were concerned to describe the formal and informal urbanization.

Legend

Informal_Classes

Low Density

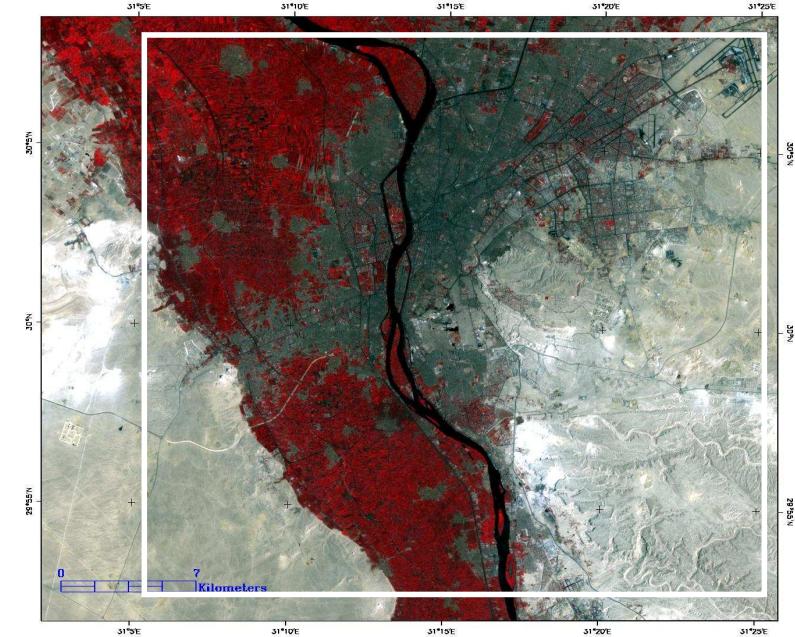

Moderate Density

High Density

V. high Density

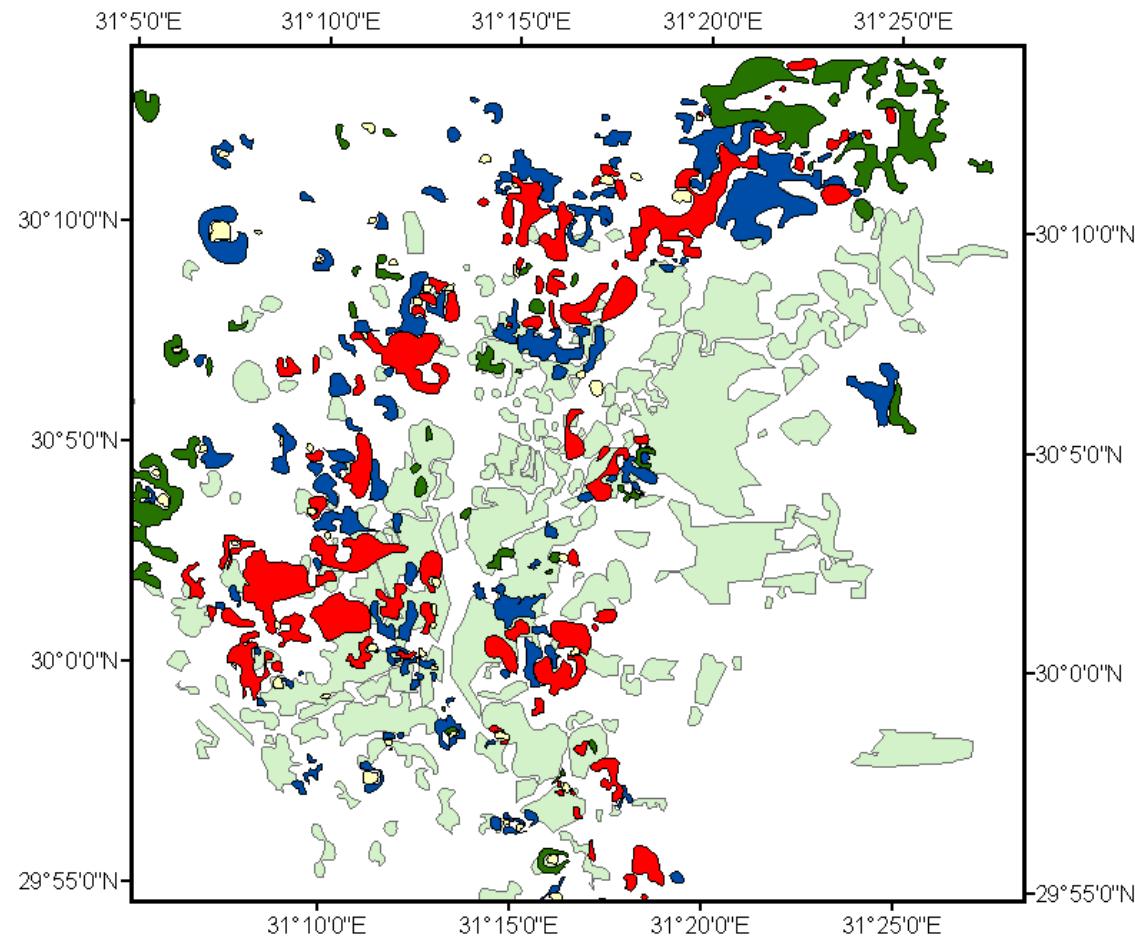

0 1,5 3 6 9 12 Kilometers

Level-2 is distinguished by four child classes.

These child classes are described as low, moderate, high, very high density of urbanization respectively

Combination map between
different classes

Outlook

- Pixel-based classification applied on Landsat TM and ETM+ time-series is useful for monitoring dynamics of megacities.
- Object-based classification deals more sufficiently with urban environment including formal and informal buildings.
- Very high image resolution is recommended for higher and higher levels of object-based segmentation and accuracy of classification.
- High densities of houses are not reflecting real population densities, due to the many houses are empty or partially empty.

Egypt is the promising country not a developing or third world country.
